

REPORT

Spring 2023 a survey to a representative sample of the population in Finland, Norway, Poland and Romania, were undertaken. The survey contained several experiments and in this report the results of the check of the randomization of treatments are presented. The main conclusion is that the randomization has worked well.

Introduction

Within the present study there were used several experimental questions to examine if there are treatments effects. The experiment is conducted so that treatments are randomized into the sample of respondents which should result in an equal distribution of respondents and respondent characteristics within each treatment group. To test the randomization of the treatments that the respondents have received a descriptive analysis for six demographic variables is undertaken, including Gender, Age, Presence of a Partner, No. of Children, Education, and Income. The randomization check is done for each individual country and for the total sample on the number of respondents (N) and the share of respondents (%). T-test and ANOVA analysis have been undertaken to examine if there are significant discrepancies between the treatment groups.

T-test – for Q6; Q9; Q22; ANOVA – for Q15; Q23; Q28

A total of six treatment groups in which there are significant differences on demographic variables (marked in bold in table 1) of which two are on the margin of what is relevant to report. This includes Question 9, treatment groups vary on age and number of children ($p \leq .001$). Question 15 treatment groups vary on age ($p \leq .05$). Question 22, treatment groups vary on presence of partner ($p \leq .01$), and number of children ($p \leq .05$). Question 23 varies on gender ($p \leq .01$).

T-test – for Q6; Q9; Q22; ANOVA – for Q15; Q23; Q28

A total of six treatment groups in which there are significant differences on demographic variables (marked in bold in table 3) of which five are on the margin of what is relevant to report. This includes Question 6 ($p \leq .05$), Question 9 ($p \leq .001$) and Question 22 ($p \leq .05$) treatment groups vary on number of children ($p \leq .05$). Question 15 ($p \leq .05$) and Question 25 ($p \leq .05$) treatment groups vary on gender ($p \leq .05$). Lastly, the results vary for income on Question 23 ($p \leq .05$).

Note: * $p \leq .05$; ** $p \leq .01$; and *** $p \leq .001$
T-test – for Q6; Q9; Q22; ANOVA – for Q15; Q23; Q28

A total of two treatment groups in which there are significant differences on demographic variables (marked in bold in table 4). This includes Question 9 for gender ($p \leq .001$) and no. of children ($p \leq .01$). Nevertheless, additionally we can point out that in the case of Q28 for Gender and Presence of partner, we can notice a higher discrepancy in the number of respondents for each of the treatments, even though the analysis did not highlight it as significant.

Note: * $p \leq .05$; ** $p \leq .01$; and *** $p \leq .001$

T-test – for Q6; Q9; Q22; ANOVA – for Q15; Q23; Q28

A total of eight treatment groups in which there are significant differences on demographic variables (marked in bold in table 5). This includes Question 6 for age ($p \leq .001$), presence of partner ($p \leq .05$) and education ($p \leq .05$). Also, Q9 ($p \leq .001$) and Q15 ($p \leq .05$) for age. The analysis also highlighted Q23 for gender ($p \leq .05$) and presence of partner ($p \leq .05$). In the case of Q28, presence of partner had a p value of $\leq .05$. Lastly, we can point out also that in the case of Q23 for Education, we can notice a higher discrepancy in the number of respondents for each of the treatments even though the analysis did not highlight it as significant.
